

## **DATA FAIRNESS REFLECTION - TASK 3**

---

### **1. Standard / Basis for Fairness**

---

To measure fairness across communities, I compared the proportion of total checkouts against the total registered members for each neighborhood. A neighborhood is considered under-represented if it has a high number of registered members but a disproportionately low number of total checkouts compared to other areas.

### **2. Key Findings & Numbers**

---

After aggregating the cleaned dataset by neighborhood:

- \* Heliopolis: High engagement with strong member-to-checkout ratios.
- \* Zamalek & Maadi: Balanced participation relative to member count.
- \* Shubra / Other Areas: Lower overall checkout counts relative to their registered member base, making them show lower activity in the dataset.

### **3. Plausible Explanation**

---

One practical reason for lower activity in certain neighborhoods could be physical accessibility or event awareness. The Reading Kickoff event and library collection points might be located closer to specific districts, making it easier for residents in those areas to participate compared to others who face transportation barriers or lack notice about events.

### **4. Recommended Next Step**

---

For the upcoming summer program, the library should set up mobile popup checkout stations or partner with local community centers in under-represented neighborhoods. This would make book borrowing more accessible without requiring members to travel long distances to the main branch.
